## Assessing the performance of metalenses to enhance the light collection of silicon photomultipliers

*Thursday, 22 September 2022 10:30 (15 minutes)*

A metalens is an emerging type of flat optical metamaterial that presents several advantages over a traditional lens, such as reduced cost and reduced bulkiness. We developed a set of software tools and fabrication procedures for the rapid development and characterization of new metalens designs. A large field-of-view centimeter-scale metalens was fabricated, and its performance compared with GEANT4-based predictions. We explored the potential in using this metalens to gain an increase in SiPM light collection in a variety of detector geometries.

**Primary author:** STANFORD, Chris (Harvard University)

**Co-authors:** Dr MARTINS, Augusto (Harvard University); Ms CONTRERAS, Taylor (Harvard University); Dr ESCOBAR, Carlos (Fermilab); Prof. GUENETTE, Roxanne (Manchester University); Mr KELLERER, Fabian (IFIC); Dr KISH, Alex (Fermilab); Mr LAWRENCE-SANDERSON, Ben (SLAC); Dr MARTIN-ALBO, Justo (IFIC); Dr PARA, Adam (Fermilab); Dr STANCARI, Michelle (Fermilab); Ms TOURE, Oumou (Fermilab)

**Presenter:** STANFORD, Chris (Harvard University)

**Session Classification:** Optics and wavelength shifters

**Track Classification:** Light/charge readout (PMT, SiPM, WLS, electronics etc.)
