

Inert compact binary formation in open clusters

Ataru Tanikawa (Fukui Prefectural University)

Collaborators: Long Wang (Sun Yat-sen University),

Michiko S. Fujii (The University of Tokyo)

MODEST-24: Exploring Dense Stellar Systems Across Cosmic Time

22 August Warsaw

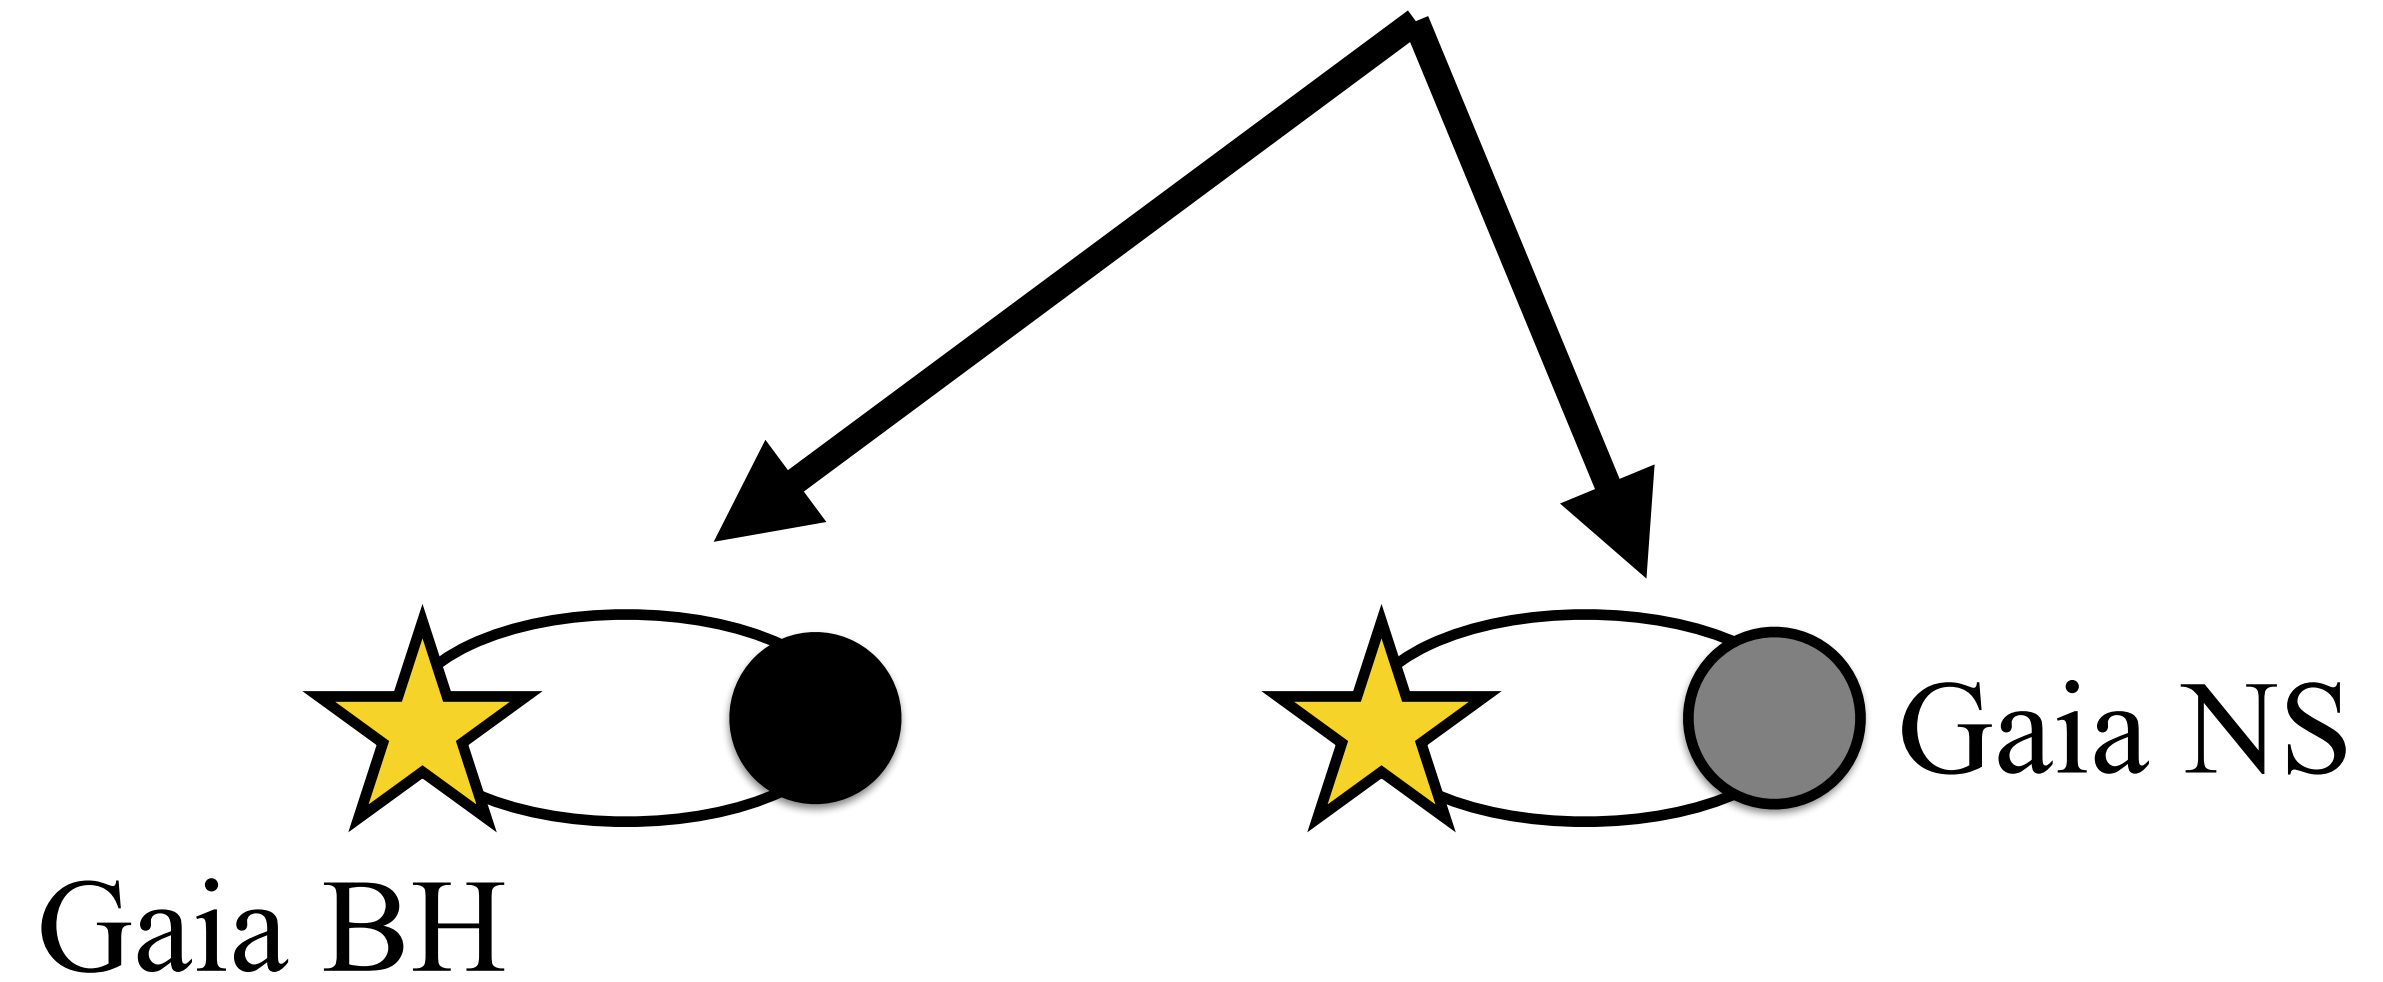

- Tanikawa et al. (2024, MNRAS, 527, 4031, arXiv:2303.05743)
- Tanikawa et al. (2024, OJAp, 7, 39, arXiv:2404.01731)

Conclusions of this talk

- Gaia mission and its follow-up observations have discovered many inert compact binaries, so-called Gaia BHs and Gaia NSs.
- These Gaia BHs and Gaia NSs cannot be formed in the conventional binary evolution model (but see Kotko et al. 2024; Iorio et al. 2024; El-Badry et al. 2024; Poojan's talk).
- Gaia BHs can be formed efficiently in open clusters (Tanikawa et al. 2024, MNRAS, 527, 4031; see also Rastello et al. 2023; Di Carlo et al. 2024; Marin Pina et al. 2024).
- But, Gaia NSs cannot (Tanikawa et al. 2024, OJAp, 7, 39).
- Gaia NS formation remains an open question.

Eiheiji: The biggest Zen Buddhism temple in Japan

Fukui, Japan

If the past few months are any indication, tourism in Japan could surpass pre-pandemic levels in 2024. To escape the urban sprawl and see one of the most spiritual parts of the country, go to Fukui. Naomi Mano, president and chief executive of the Tokyo-based travel company Luxurique, says the city is a destination for temples, onsens (hot spring baths), art and food (specifically Echizen crab). With a new bullet train line set to open in March, travelers can get to Fukui from Tokyo in about three hours.

Natal kick?

- $m_1 = 10M_{\odot}$, $m_2 = 1M_{\odot}$
- $a_i = 0.025$ au, $e_i = 0 \implies a_i = 2.5$ au
- Large kick velocity is needed ($v_k \gtrsim 250$ km/s).
- Center-of-mass velocity exceeds ~ 250 km/s.
- Inconsistent with the fact that Gaia BHs are the Galactic disk components.
- Eccentricity is quite high ($\gtrsim 0.99$).
- Inconsistent with moderate eccentricities of Gaia BHs (~ 0.5).

The number of Gaia BHs captured by PBHs

- $N_{\text{GBH}} = N_{\text{PBH}} n_{\text{star}} \sigma v T$

- $N_{\text{PBH}} \sim 2 \times 10^3 \left(\frac{M_{\text{DM}}}{2 \times 10^{11} M_{\odot}} \right) \left(\frac{M_{\text{PBH}}}{10 M_{\odot}} \right)^{-1} \left(\frac{f_{\text{PBH}}}{10^{-3}} \right) \left(\frac{f_{\text{disk}}}{10^{-3}} \right) \left(\frac{f_{\text{corotate}}}{0.1} \right)$

- $n_{\text{star}} \sim 2 \text{ pc}^{-3} \left(\frac{M_{\text{disk}}}{6 \times 10^{10} M_{\odot}} \right) \left(\frac{M_{\text{star}}}{1 M_{\odot}} \right)^{-1} \left(\frac{R_{\text{disk}}}{10 \text{ kpc}} \right)^{-2} \left(\frac{h_{\text{disk}}}{100 \text{ pc}} \right)^{-1}$

- $\sigma = \pi a^2 \left(1 + \frac{G(M_{\text{PBH}} + M_{\text{star}})}{av^2} \right) \sim 5.8 \times 10^{-10} \text{ pc}^2 \left(\frac{M_{\text{PBH}} + M_{\text{star}}}{11 M_{\odot}} \right) \left(\frac{a}{1 \text{ au}} \right)^{-1} \left(\frac{v}{50 \text{ km/s}} \right)^{-2}$

- $N_{\text{GBH}} \sim 1 \left(\frac{N_{\text{PBH}}}{2 \times 10^3} \right) \left(\frac{n_{\text{star}}}{2 \text{ pc}^{-3}} \right) \left(\frac{\sigma}{5.8 \times 10^{-10} \text{ pc}^2} \right) \left(\frac{v}{50 \text{ km/s}} \right) \left(\frac{T}{10 \text{ Gyr}} \right)$

No natal kick model

- We reduce NS natal kicks to zero.
- The formation efficiency of Gaia NSs is still comparable to that of Gaia BHs.
- Moreover, Gaia NSs are formed from primordial binaries, not through dynamical capture.
- No need to consider Gaia NS formation in open clusters in this case.
